No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A_Geneseq_0401:*

The peptide antagonists are based on a common motif of ZOT combinding. They can be prepared by chemical synthesis or by use of cantinflammattory agents in the treatment of gastrointestinal common motif of ZOT combinant DNA techniques. The peptide antagonists are used as an common material synthesis or by use of cantinflammattory agents in the treatment of gastrointestinal continuous properties and yet does not physiologically modulate the opening of TJ in the contract of the strine. Gastrointestinal inflammation conditions give rise to compare they bind to the ZOT receptor in the intestine caused by infection, e.g. Clostridium difficule infection, contesting intestinal conditions that cause protein losing enteropathy contesting infection, e.g. Clostridium difficule infection, contesting infection, bacterial overgrowth, whipple sidesase, disease, disease, disease, olitis, inflammatory bowel disease, disease, disease, disease, disease, contesting correction of congenital heart disease with Fontan's operation, concerning the micropality concerning the mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, concerning the micropality disease, without ulceration, e.g. Menetrier's disease, cosinophilic gastroenteritis, and immune diseases, cosinophilic gastroenteritis, primarily to micropal disease, essimphilic gastroenteritis, primarily to micropal disease, primarily to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                  CC (TU). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC indiang. They can be prepared by chemical synthesis or by use of CC antiinflammatory agents in the treatment of gastrointestinal CC inflammation, where they bind to the ZOT receptor in the intestinal CC and yet does not physiologically modulate the opening of Ty in the CC increased intestinal conditions that cause protein loss useful for CC treating intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, conference infestation, bacterial overgrowth, whipple's disease, diseases with CC infestation betruction, e.g. congenital intestinal sparasite CC infestation betruction, e.g. congenital intestinal sparasite correction of congenital heart disease, diseases marked by Sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, collisions without ulceration, e.g. wenettier's disease, e.g. systemic lupus exythematosus or food allernies and immune diseases'

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC (TJ). The peptide antagonists are based on a common motif of ZOT CC and human zonulins, which is believed to be critical for receptor CC binding. They can be prepared by chemical synthesis or by use of CC antiinflammattony agents in the treatment of gastrointestinal antiinflammattony agents in the treatment of gastrointestinal confilmmatton, where they bind to the ZOT receptor in the intestine CC inflammatton, where they bind to the ZOT receptor in the intestine CC intestine. Gastrointestinal inflammation conditions give rise to concreased intestinal permeability and the peptide is useful for CC intesting intestinal conditions that cause protein losing enteropathy CC caused by infection, e.g. Clostridium difficile infection, conterocolitis, shigellosis, viral gastroenterits, parasite concomicus, shigellosis, viral gastrointestinal cancer, CC collagenous colitis, inflammatory bowel disease, diseases with CC uncosal erosion or ulcerations, e.g. satricis, gastric cancer, CC collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, CC sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical CC correction of congenital heart disease with Fontan's operation, CC coeliac disease, eosinophilic gastroenteritis, and immune disease, coeliac disease, eosinophilic gastroenteritis, and immune disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ind human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of crecombinant DNA techniques. The peptide antagonists are used as an antiinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 207 receptor in the intestine cand yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, e.g. clostridium difficile infection, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, parasite collagenous colitis, inflammatory bowel disease, diseases marked by implantic obstruction, e.g. congenital intestinal lymphanglectasia, carcoidosis lymphoma, mesenteric tuberculosis, and after surgical corrections of symphoma, mesenteric tuberculosis, and some surgical corrections of symphoma, mesenteric tuberculosis, and some surgical corrections.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The synthetic gene encodes a protein corresponding to an antibody capable of binding to a specific antigen, in this case the HIV-1 tat protein. Many synthetic genes are synthesised, each containing a the heavy and light chains of encoding the framework regions of regions which are random sequences. The genes are then used in the construction of vectors which are subsequently used to transform microbes. The proteins thus produced are screened for binding activity to the specific antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen-binding proteins and corresp. synthetic genes - are constructed synthetically and used to make antibody library, in disease diagnosis, etc.

This present sequence is that of a peptide antagonist of zonulin (2), one of 25 such peptides (see Y79105-29) of the invention, which bind to a zonula occludens toxin (20T) receptor, yet do not (TJ). The peptide antagonists are based on a common motif of 20T binding. They can be prepared by chemical synthesis or by use of antinflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the 20T receptor in the intestine and yet does not physiologically modulate the opening of TJ in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
A79263 to A79736 and B25100 to B25570 represent polynucleotide and protein sequences isolated from eucalyptus (Eucalyptus grandis) or pir (Pinus radiata also known as Monterey pine). The protein sequences are involved in cell signalling. The polynucleotide and protein sequences can be used to modify the response of plant cells to external signals e.g. environmental changes or pathogens during the growth and develope of a plant. They can be used to modify cell proliferation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphangiectasia, sarcoidosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with Fontan's operation, mucosal diseases without ulceration, e.g. Menetrier's disease, coeliac disease, eosinophilic gastroenteritis, and immune diseases, esg. systemic lupus erythematosus or food allergies, primarily to

                                                           sp. N-774 and Rhodococcus rhodochrous J-I.
Plasmid pYUK121 contg. nitrile hydratase gene derived from Rhodococcus sp. N-774 is prepd. from a JM105/pYUK121 culture. pYUK121 DNA is digested with SphI and Sali. This fragment contains the nitrile hydratase gene which is radiolabelled for use as probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        differentiation, elongation and survival, resistance to disease and nutrient metabolism. Examples of modifications which can be produced are altered fruit ripening and senescence of leaves and flowers e.g. to delay senescence and prolong the life of cut flowers or enhance senescence of reproductive organs to engineer sterile plants. Other modifications can be used to delay senescence in selected cell types or organs providing fruit and vegetables which have a longer shelf life between harvest and consumption, or to decrease branching frequency in forest tree species giving long stretches of valuable knot-free clear wood which can be used in solid timber furniture and veneers.
                                                                                                                      A DNA probe is prepd. from JM105/pYUK121 (FERM BP-1937) described JP-A-2-119778/1990 due to the high degree of homology in the amino sequence between the nitrile hydratase beta subunit of Rhodococcus

                                                                                                                                                                                This is the amino acid sequence of the nitrile hydratase alpha subunit from Rhodococcus rhodochrous strain IFO15564. The coding sequences were isolated by screening a genomic R. rhodochrous DNA library in EMBL3 amplified a 0.7 kb fragment of the amidase gene. The library screen isolated a phage containing a 15 kb insert. When analysed, the insert containing the open reading frames for the amidase gene (5287) inlitrile hydratase alpha and beta subunits and another open reading frames for the amidase gene (763385), the encoding a 399 amino acid protein (W14162) of unknown function. The enzymes, prepared by genetic engineering methods, can be used in the industrial production of useful compounds.

                                                                                                                                                                                                                                                                                                                                         The specification describes the production of halogenated benzamides by enzymatic hydrolysis of halogenated benzonitriles using a Brevibacterium nitrile hydratase. This enzyme is a tetrameric enzyme comprising 2 alpha and 2 beta chains. The present sequence represents is derived (strain R312 or its mutant A4) have higher activity for thydrolysing halogenated benzonitriles than for hydrolysing benzonitrile. The method is especially for preparing 2,6-difluorobenzamide, which is an intermediate for insecticides, especially diflubenzuron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Halogenated benzamide production - by halogenated benzonitrile hydrolysis with Brevibacterium nitrile hydratase enzyme

                                                                                                                                                                                                                                                                                                                                                                                          recombinant DNA techniques. The peptide antagonists are used as an attininflammatory agents in the treatment of gastrointestinal inflammation, where they bind to the ZOT receptor in the intestine and yet does not physiologically modulate the opening of TJ in the intestine. Gastrointestinal inflammation conditions give rise to increased intestinal permeability and the peptide is useful for treating intestinal conditions that cause protein losing enteropathy caused by infection, e.g. Clostridium difficile infection, enterocolitis, shigellosis, viral gastroenteritis, parasite infestation, bacterial overgrowth, whipple's disease, diseases with mucosal erosion or ulcerations, e.g. gastritis, gastric cancer, collagenous colitis, inflammatory bowel disease, diseases marked by lymphatic obstruction, e.g. congenital intestinal lymphanglectasia, sarcoldosis lymphoma, mesenteric tuberculosis, and after surgical correction of congenital heart disease with fontan's operation, mucosal disease, eosinophilic gastroenteritis, and immune disease, e.g. systemic lupus erythematosus or food allergies, primarily to

The peptide antagonists are based on a common motif of ZOT and human zonulins, which is believed to be critical for receptor binding. They can be prepared by chemical synthesis or by use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 1; Page 43; 69pp; English.

partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer. Agonists and antagonists to the antigens can be screened for. The pancreatic cancer antigen polynucleotides can be used to design nucleic acid hybridisation probes that can be used in chromosome mapping, linkage analysis, tissue identification and/or typing and a variety of forensic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to treat or prevent neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal or proliferative disorders. C99232 to C99240 and B54467 represent sequences used in the exemplification of the present intention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunomodulatory, relaxant, contraceptive, gynaecological, card antiinflammatory activities, and can be used in gene therapy. T polynucleotide and proteins can be used for preventing, treatin ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 called pancreatic cancer antigens, given in B4008 to B54066 pancreatic cancer antigens have cytostatic, neuroprotective, immunomodulatory, relaxant, contraceptive, gynaecological, contiinfiammatory activities, and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          detection; diagnosis; identification; cytostatic; neuroprotective; nootropic; immunomodulatory; relaxant; contraceptive; gynaecologic antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analysis; tissue identification; tissue typing; forensic;

CC -1- FUNCTION: REGULATORY PHOTORECEPTOR WHICH EXISTS IN TWO FORMS THAT CC ARE REVERSIBLY INTERCONVERTIBLE BY LIGHT: THE PR FORM THAT ABSORBS CC ARE REVERSIBLY INTERCONVERTIBLE BY LIGHT: THE PR FORM THAT ABSORBS CC ARE REVERSIBLY IN THE FEB REGION OF THE SPECTRUM AND THE PER FORM THAT CC CAMBORIS MAXIMALLY IN THE FAR-RED REGION. PHOTOCONVERSION OF RINDUCES AN ARRAY OF MORPHOGENIC RESPONSES, WHEREAS CC RECONVERSION OF PR TWO MORPHOGENIC RESPONSES, WHEREAS CE RECONVERSION OF PR CANCELS THE INDUCTION OF THOSE CC GENES INCLUDING THOSE EXPORENSION OF A NUMBER OF NUCLEAR CC GENES INCLUDING THOSE EXPONSEN SMALL SUBUNIT OF RIBULOSE-PROTOCHLOROPHYLLIDE REDUCTASE, CHLOROPHYLL A/B BINDING PROTEIN, CC THE EXPRESSION OF A SIRINDAY LASE, CHLOROPHYLL A/B BINDING PROTEIN, CT. THE EXPRESSION OF A SIRINDAY HOMONTMER REDUCTASE, RNAA, ETC. IT ALSO CONTROLS CC. THE EXPRESSION OF THOSE SHOULD ASE, SIRINDAY FEEDBACK FASHION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁

                                    RT glutathione-dependent formaldehyde dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase from Escherichia RT coll: a class III alcohol dehydrogenase.";

RL Blochemistry 31:475-481(1992).

CC PRESENCE OF GLUTATHIONE AND CATALYZES THE OXIDATION OF NORMAL COMEGNATION IN A REACTION THAT IS NOT GSH DEPENDENT. IN ADDITION, COMEGNATHIOLACETALS OTHER THAN THOSE FORMED FROM GSH, INCLUDING COMEGNATHIOL FATTY ACIDS, ALSO ARE SUBSTRATES.

C --- CATALYTIC ACTIVITY: ALCOHOL + NAD(+) = ALDEHYDE OR KETONE + NADH.

S-FORMYLGLUTATHIONE + NADH.

--- SUBCELLULAR LOCATION: CYTOPLASMIC.

--- SUBCELLULAR LOCATION: CYTOPLASMIC.

--- SIMILARITY: BELONGS TO THE ZINC CONTAINING ALCOHOL DEHYDROGENASE FAMILY, CLASS-III SUBFAMILY.

--- CAUTION: REF. 1 AND PERS 1

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  80

Sequence 3, Application US/08537002A Patent No. 5773282

GENERAL INFORMATION:

APPLICANT: TSUSAKI, Keiji
APPLICANT: KUBOTA, Michio
APPLICANT: SUGIMOTO, TOShiyuki
TITLE OF INVENTION: RECOMBINANT THERMOSTABLE ENZYME FOR
TITLE OF INVENTION: CONVERTING MALTOSE INTO TREHALOSE
NUMBER OF SEQUENCES: 17

NUMBER OF SEQUENCES: 1

ADDRESSEE:

CITY: Washington STATE: D.C.
